1. The minimum number of clock cycles is determined by dividing the minimum time required with clock cycle time, and then rounding off to the next higher integer.
2. Minimum delay is required to complete write.
3. All parts allow every cycle column address change.
4. In case of row precharge interrupt, auto precharge and read burst stop.

Parameter	Symbol	Value		Unit	Note
		Min	Max		
CLK cycle time	tCC	7.5	1000	ns	1
CLK to valid output delay	tSAC		5.4	ns	1, 2

CLK to output in Hi-Z	tSHZ		5.4	ns	

Note: 1. Parameters depend on programmed CAS latency.
2. If clock rising time is longer than 1ns, (tr/2-0.5)ns should be added to the parameter.
3. Assumed input rise and fall time (tr & tf)= 1ns.
If tr & tf is longer than 1ns, transient time compensation should be considered,
i.e., [(tr + tf)/2-1]ns should be added to the parameter.

(V=Valid, X=Don't Care, H=Logic High, L=Logic Low)

Note:
1. OP Code : Operand Code
   A_0~A_{12}, BA_0~BA_1 : Program keys. (@MRS)
2. MRS can be issued only at all banks precharge state.
   A new command can be issued after 2 CLK cycles of MRS.
3. Auto refresh functions are as same as CBR refresh of DRAM.
   The automatically precharge without row precharge command is meant by "Auto".
   Auto/self refresh can be issued only at all banks precharge state.
4. BA_0~BA_1: Bank select address.
   If both BA_0 and BA_1 are "Low" at read, write, row active and precharge, bank A is selected.
   If both BA_0 is "Low" and BA_1 is "High" at read, write, row active and precharge, bank B is selected.
   If both BA_0 is "High" and BA_1 is "Low" at read, write, row active and precharge, bank C is selected.
   If both BA_0 and BA_1 are "High" at read, write, row active and precharge, bank D is selected.
   If A_{10}/AP is "High" at row precharge, BA_0 and BA_1 is ignored and all banks are selected.
5. During burst read or write with auto precharge, new read/write command can not be issued.
   Another bank read/write command can be issued after the end of burst.
   New row active of the associated bank can be issued at tRP after the end of burst.
6. Burst stop command is valid at every burst length.
7. DQM sampled at positive going edged of a CLK masks the data-in at the very CLK (Write DQM latency is 0), but makes Hi-Z state the data-out of 2 CLK cycles after. (Read DQM latency is 2)
